I. Summary and Highlights

This report presents population projections for Ontario and each of its 49 regional municipalities, counties and districts, by age and sex, from 1999 to 2028. Detailed projections are provided following every Census, in this case the 1996 Census. These projections replace the ones last published by the Province of Ontario in January 1994, following the 1991 Census. The projections at the sub-provincial level are consistent with the projections for Ontario as a whole.

Three forecast scenarios are provided. The medium or reference scenario is considered "most likely" and is recommended for most long-term planning purposes. The high and low growth scenarios provide a reasonable forecast range.

The projections are developed to assist municipalities and government ministries with their long-term planning. It should be noted that the projections are not Government policy targets.

The projections are developed by applying to the existing population base assumptions about key demographic variables, such as fertility and mortality, and the flow of population to and from the province and among regions of the province. The base population (for Ontario and 49 Census Divisions) is the updated July 1, 1999 postcensal estimate, first released by Statistics Canada in January 2000. For Ontario, this was 11.5 million.

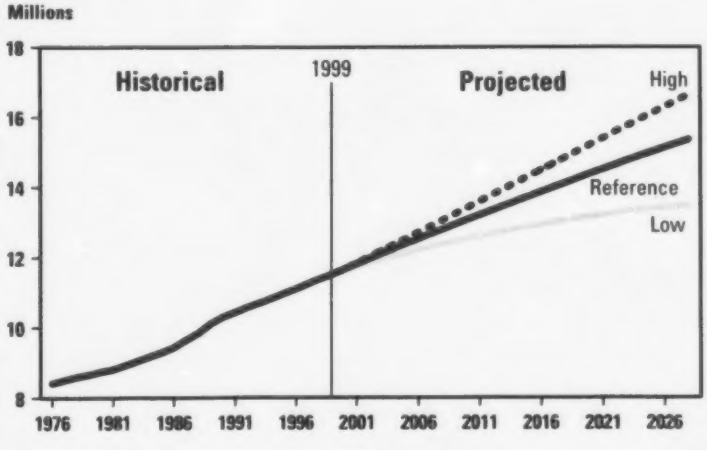
Highlights of the projections (reference scenario unless otherwise stated) are presented below:

- Ontario's population is projected to experience fairly robust growth over the projection period under all three scenarios.
- The population of Ontario is projected to grow by 33.4 per cent or 3.8 million, from an estimated 11.5 million on July 1, 1999 to almost 15.4 million on July 1, 2028. The population reaches 13.5 million under the low growth scenario and 16.6 million under the high growth scenario by 2028.
- During the first 10-year period, the annual rate of growth averages 1.2 per cent compared to 1.3 per cent during the previous decade. Over the full projection period, the annual rate of population growth declines, from 1.3 per cent in the first year of the projections to 0.7 per cent by the year 2027-28.
- As a percentage of Canada's population, Ontario's share will continue to increase. Ontario's share was 36 per cent in 1981, 38 per cent in 1999, and reaches 42 per cent by 2026, the end of the Statistics Canada projection period for Canada.
- The number of births, estimated to be 131,000 in the first year, remains essentially the same during the first three years, then starts to increase due to more women of child-bearing age and to the slightly increasing fertility rates assumed in the reference scenario. The number of births reaches 150,000 at the end of the projection period. The fertility rate is assumed to increase slightly from 1.53 to 1.55 by the end of the projection period.

- The number of deaths continues to increase as baby boomers age. From 83,000 in the first year, the annual number of deaths reaches 134,000 by the end of the projection period.
- Because deaths will rise faster than births, natural increase in population will continue to decline during the projection period but will remain positive in the reference and high scenarios. In the low scenario, a pattern of natural decrease (more deaths than births) occurs starting about the year 2020.
- Over the decade 1999-2009, net migration adds one million to the population of Ontario, accounting for 71 per cent of total population increase. Over the full projection period, net migration will increase in importance and will account for 75 per cent of total population growth. Immigration is the most important component of migration.
- The median age of Ontario's population rises to 43 years in 2028, from 36 years in 1999. The median age for women climbs from 37 to 44 years, and the median age for men increases from 35 to 42 years.
- The population age 65 and over more than doubles from 1.4 million or 12.5 per cent of the population in 1999 to 3.2 million or 21.1 per cent in 2028. The population age 75 and over will more than double, increasing from 0.6 million or 5.4 per cent of the population to 1.4 million or 9.3 per cent. The growth in seniors' share of the population will accelerate after 2011 as baby boomers begin to turn age 65. This same cohort will begin to reach age 75 a decade later, in 2021.
- The number of children under age 15 rises by only 100,000, from 2.3 million to 2.4 million, while their share of the population falls from 19.7 per cent in 1999 to 15.4 per cent in 2028.
- The working age population, ages 15-64, will increase by 25 per cent, from 7.8 million in 1999 to 9.7 million by 2028. Within this age group, the most rapid increase is among those over age 45. The share of the population that is of working age will rise gradually from 67.7 per cent in 1999 to peak at 69.6 per cent in 2011, after which it will fall to 63.5 per cent by 2028.
- The overall dependency ratio (calculated as the ratio of the 0-14 and the 65+ age groups to the 15-64 age group) remains favourable for the first 10 years, falling gradually from 48 "dependants" for every 100 working-age individuals in 1999 to 44 "dependants" in 2011. The favourable pattern of low dependency ratios will begin to change after 2011 with the arrival of large cohorts of baby boomers in the group age 65 and over, and will climb to 58 "dependants" by the year 2028.
- All regions of Ontario will experience growth. The Greater Toronto Area (Toronto and the regional municipalities of Durham, York, Peel and Halton) will be the fastest-growing region and is projected to grow from 5.1 million in 1999 to 7.5 million by the year 2028. The GTA's share of total Ontario population will rise from 44 per cent in 1999 to almost 49 per cent, or close to one-half of Ontario's population, in 2028.

- Toronto's population is forecast to increase from 2.5 million in 1999 to 2.95 million in 2028. Growth in the other regions of the GTA (Durham, Halton, Peel and York) will add about 2 million people to the GTA.
- The population of Central Ontario will grow from 2,545,000 to 3,379,000. The region's share will remain essentially unchanged at about 22 per cent. Most Census Divisions surrounding the GTA (Simcoe, Dufferin, Wellington, Waterloo and Victoria) will continue to experience above-average population growth.
- The population of Eastern Ontario will grow from 1,549,000 to 1,873,000 over the projection period. Ottawa-Carleton is projected to grow from 764,000 in 1999 to almost one million (955,000) in 2028. Census Divisions near Ottawa-Carleton such as Prescott and Russell and Lanark also will experience above-average population growth.
- The population of Southwestern Ontario will grow from 1,508,000 to 1,747,000. Growth rates for Southwestern Ontario vary, with the Census Divisions of Elgin and Essex projected to have growth rates close to the provincial average.
- The population of Northern Ontario is projected to increase from 839,000 in 1999 to 868,000 by 2028. Growth rates within Northern Ontario vary.

Population Projections, Ontario



Sources: Statistics Canada, 1976-1999, and Ontario Ministry of Finance projections.

II. Introduction

This report presents population projections for Ontario and each of its 49 Census Divisions (i.e., regional municipalities, counties and districts) by age and sex, from 1999 to 2028. Detailed projections are provided following every Census, in this case the 1996 Census. The projections replace the ones last published by the Province of Ontario in January 1994, following the 1991 Census. The projections at the sub-provincial level are consistent with the projections for Ontario as a whole.

The projections are based on the Statistics Canada 1999 updated postcensal population estimates. 1999 Ontario population estimates by Census Division (CD) were first released by Statistics Canada in January 2000.

The technique used is the regional cohort-component method. The modelling begins with the population estimates by age and sex in the base year, 1999. The population is "aged" one year at a time, with assumed fertility and mortality rates generating births and deaths in each year. Additional assumptions are made about the annual level and the age-sex composition of each of four migration streams (immigration, net emigration, interprovincial and intraprovincial in- and out-migration).

The projections are based on assumptions developed by the Ontario Ministry of Finance but were produced using Statistics Canada's regional cohort-component method and projections model.

The first part of this report provides a discussion of projection results, including Ontario's projected population under the reference, high and low growth scenarios; a discussion of the components of population growth, age structure and regional distribution; and a brief comparison of the new projections and the previous projections. The report also provides a description of the methodology and the assumptions underlying each scenario.

The other half of the report is a detailed Statistical Appendix of the most commonly requested tables.

III. Projection Results

Reference, High and Low Scenarios

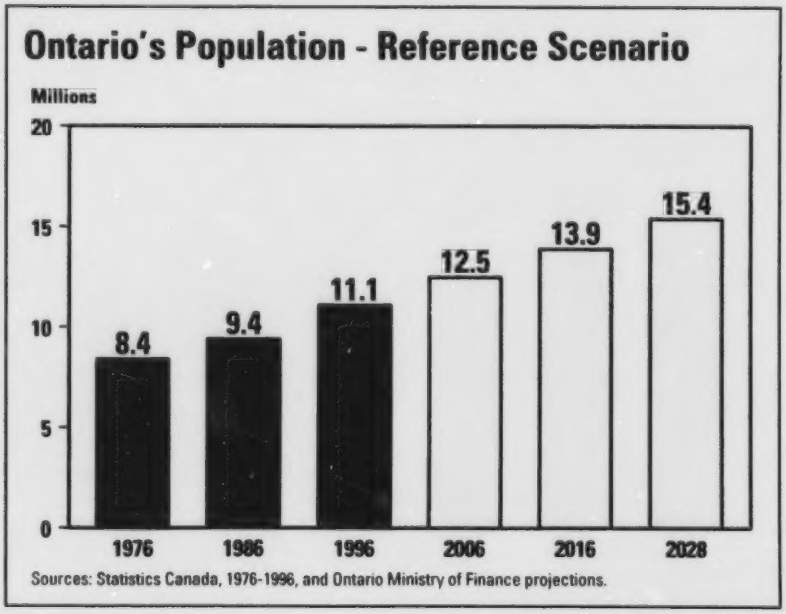
The projections provide a range of plausible growth scenarios for the population of Ontario over the next three decades.

The medium growth or *reference scenario* combines a slightly increasing fertility level, a moderate decline in mortality and a quasi-constant migration level.

The *high growth scenario* combines an increasing fertility assumption and a faster decline in mortality with higher migration levels.

The *low growth scenario* is based on a declining fertility rate, a slower decline in mortality and lower migration levels.

In all three scenarios, Ontario's population is projected to experience fairly robust growth over the projection period. From the 11.5 million estimated as of July 1999, the population of Ontario is projected to reach almost 15.4 million in the reference scenario, a growth of 33.4 per cent. The population is projected to grow to 13.5 million in the low growth scenario, and to 16.6 million in the high growth scenario.



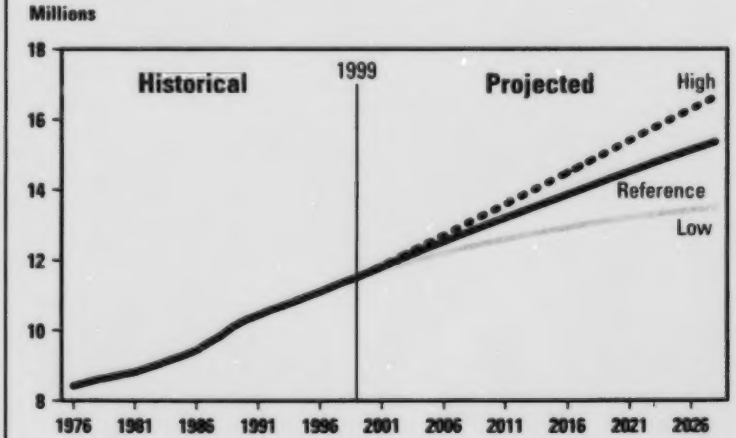
The increase over the whole projection period amounts to 3.8 million in the reference scenario, 2.0 million in the low and 5.1 million in the high growth scenario.

Over the projection period, the rate of population growth will decline in the reference scenario from 1.3 per cent in the first year to 0.7 per cent in the last year. The rate of growth in 2027-28 is 0.2 per cent in the low scenario and 1.1 per cent in the high scenario.

During the first 10-year period, the annual rate of growth in the reference scenario averages 1.2 per cent compared to an average of 1.3 per cent during the previous decade. The average annual rate of growth is projected to slow to 1.0 per cent in the second decade and 0.8 per cent in the last decade of the projections. In the low scenario, the annual rate of growth averages 0.8 per cent in the first, 0.5 per cent in the second and 0.3 per cent in the last decade of the projections. Similarly, annual rates of growth under the high scenario assumptions are 1.4 per cent, 1.3 per cent and 1.1 per cent for the first, second and last decade, respectively.

As a percentage of the overall Canadian population, Ontario's share will continue to increase. Ontario's share was 36 per cent in 1981 and 38 per cent in 1999. Under the reference scenario, it is projected to reach 42 per cent by 2026, the end of the Statistics Canada projection period for Canada.

Population Projections, Ontario



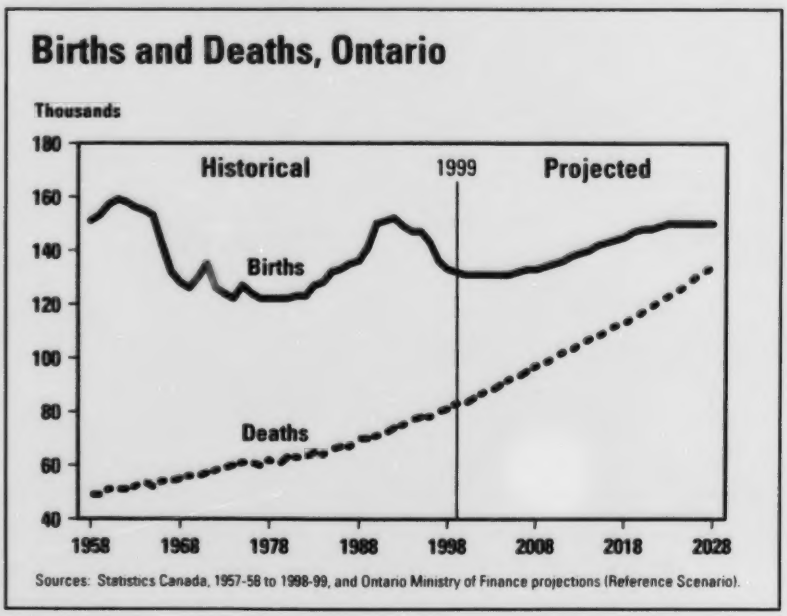
Sources: Statistics Canada, 1976-1999, and Ontario Ministry of Finance projections.

The Components of Population Change

Diminishing natural increase is the main factor contributing to a slowing rate of population growth. This is the consequence of several decades of declining fertility (fewer births) and the arrival of large cohorts of baby boomers at older ages (more deaths).

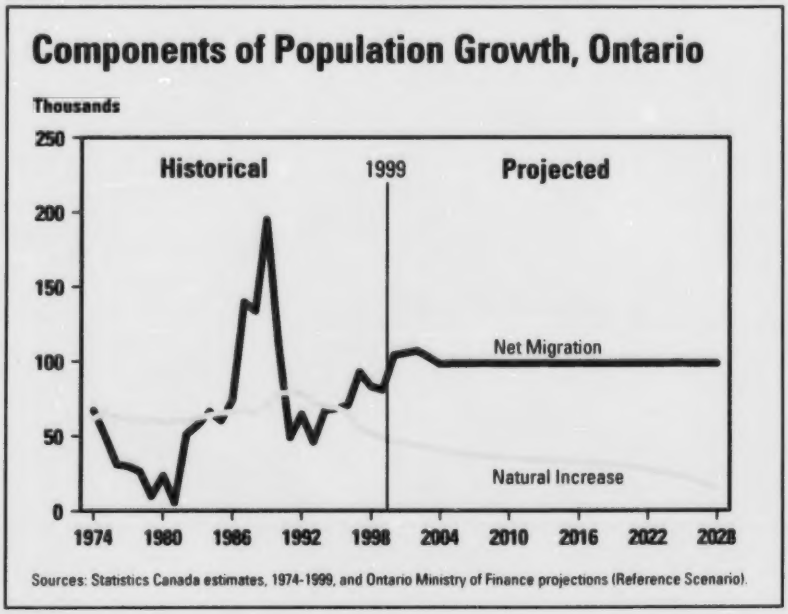
The number of births, estimated to be 131,000 in the first year (1999-2000), changes little in the reference scenario during the first three to four years. After that, births start to increase due to larger cohorts of women in child-bearing ages and a slightly increasing fertility rate. The number of births reaches 150,000 at the end of the projection period. Under the declining fertility assumption (low scenario), births decrease to 113,000 while births increase to 175,000 under the high fertility assumption.

Annual deaths will continue to increase as baby boomers age. From 83,000 in the first year, the number of deaths reaches 134,000 by the end of the projection period in the reference scenario, and 137,000 and 130,000 in the low and high scenarios respectively.



Because deaths will rise faster than births, natural increase in population will continue to decline but will remain positive throughout the projection period in the high growth and reference scenarios. From 47,000 in the first year, natural increase declines to 15,000 in the reference scenario and to 45,000 in the high scenario. In the low scenario, a pattern of natural decrease (more deaths than births) occurs starting about the year 2020.

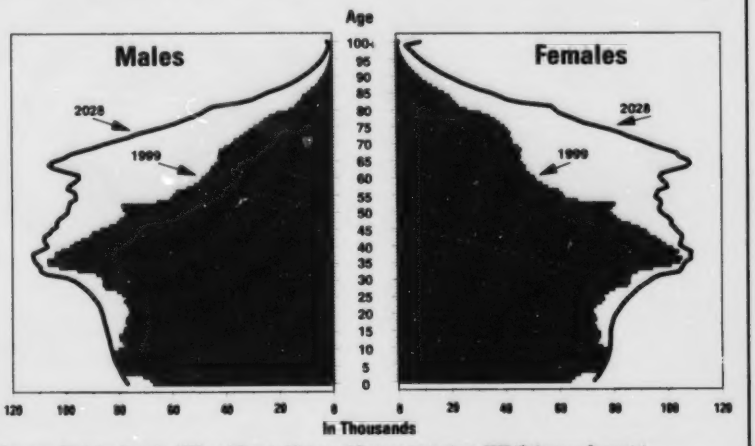
Migration is a very significant contributor to the demographic growth of Ontario. Over the first decade of the projections, 1999-2009, net migration will add almost one million to the population of Ontario, accounting for 71 per cent of total population increase in the reference scenario. Over the full projection period, in the reference scenario, net migration will account for 75 per cent of total population growth and add 2.9 million people to Ontario's population. Over this same period, Ontario gains 3.7 million people in the high scenario and 1.6 million people in the low scenario as a result of net migration.



Age Structure

Over the projection period, the structure of Ontario's population will change, with a shift to more seniors.

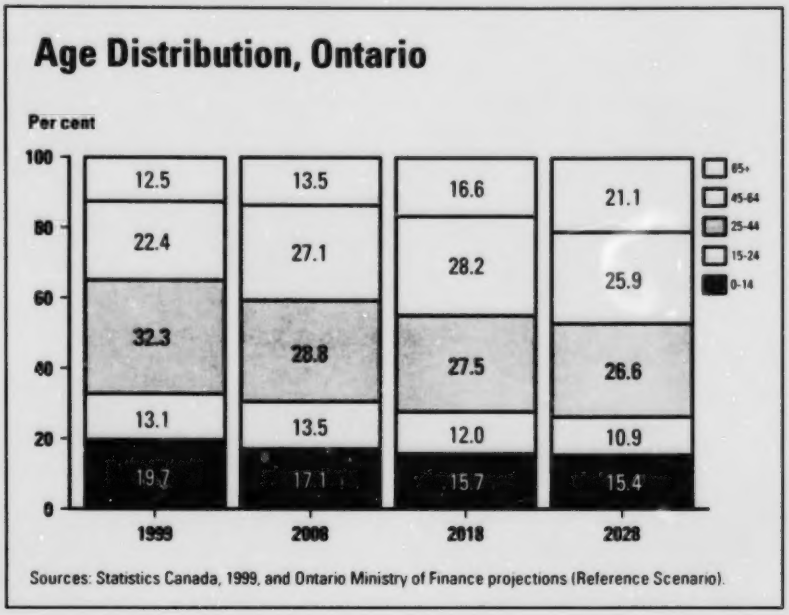
Age Pyramid of Ontario Population, July 1, 1999 and 2028



Sources: Statistics Canada, 1999, and Ontario Ministry of Finance projections, 2028 (Reference Scenario).

The population age 65 and over will rise significantly, from 1.4 million or 12.5 per cent of the population in 1999 to 3.2 million or 21.1 per cent in 2028. The population age 75 and over will more than double and increase from 0.6 million or 5.4 per cent to 1.4 million or 9.3 per cent over the same period. The growth in seniors' share of the population will accelerate after 2011 as baby boomers begin to turn age 65. This same cohort will begin to turn age 75 a decade later, in 2021.

By contrast, the number of children under age 15 will rise only marginally in the reference scenario, from 2.3 million to 2.4 million, while their share of the population will fall from 19.7 per cent in 1999 to 15.4 per cent in 2028. In the high growth scenario, the number of children under age 15 increases to 2.7 million, reflecting the higher fertility rate, and their share falls to 16.3 per cent. Given the declining fertility assumption, the number of children falls to 1.9 million in the low growth scenario and their share falls to 13.8 per cent.

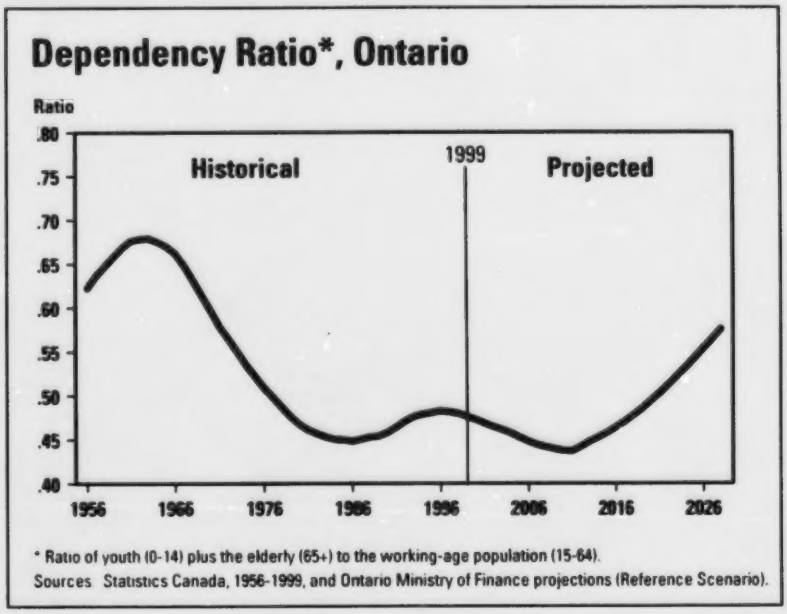


The working-age population, ages 15-64, increases by 25 per cent, from 7.8 million in 1999 to 9.7 million by 2028. Within this group, the most rapid increase is among workers over age 45. The share of the population that is of working age will rise gradually from 67.7 per cent in 1999 to peak at 69.6 per cent in 2011, after which it will fall to 63.5 per cent by 2028. In the high and low growth scenarios, the working-age population will rise to 10.5 million and 8.6 million, respectively, and will comprise about 63 per cent of the population, as is the case in the reference scenario.

The median age of Ontario's population will rise from 36 years in 1999 to 43 years in 2028. The median age for women will climb from 37 to 44 years. The median age for men will increase from 35 to 42 years. Under the high and low scenarios, the median age of Ontario's population will rise to 42 and 44 years respectively.

At older ages, the number of women will continue to exceed the number of men because of the higher life expectancy of women. Currently, there are 166 females per 100 males among those age 75 and over. By 2028, there will be 138 females per 100 males. The ratio will decrease because of the assumption of a narrowing gap between male and female life expectancies underlying these projections.

Under all three scenarios, the overall dependency ratio, the ratio of the 0-14 and the 65+ age groups to the 15-64 age group, remains favourable (i.e., low) for the first 10 years. Currently, there are 48 "dependants" (ages 0-14 and 65+) for every 100 working-age individuals. By 2011, this dependency ratio is projected to decline to 44. This pattern of low dependency ratios will begin to change after 2011 with the arrival of large cohorts of baby boomers in the group age 65 and over. By the year 2028, the dependency ratio will have climbed to 58, similar to the early 1970s. However, this time it will be the increasing senior population, rather than the number of children, that will be the driving force behind the rising dependency ratio.



* Ratio of youth (0-14) plus the elderly (65+) to the working-age population (15-64).

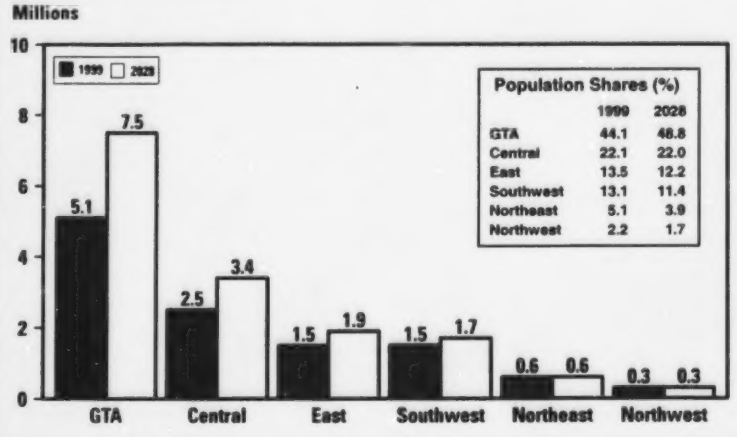
Regional Distribution

In these projections, the contribution of natural increase to regional population growth will no longer be as important as it was in the past. This will be felt particularly in those regions that do not gain significantly from migration.

All regions of Ontario will experience growth. The Greater Toronto Area (Toronto and the regional municipalities of Durham, Halton, Peel and York) is projected to be the fastest-growing region. It is projected to increase from 5.1 million in 1999 to 7.5 million by the year 2028. The GTA's share of total Ontario population will rise from 44 per cent in 1999 to almost 49 per cent in 2028, or close to one-half of Ontario's population. International migration into the GTA is a very significant factor in the projected increase in the GTA's population and share.

Regional Population, Ontario, 1999 and 2028



Sources: Statistics Canada, 1999, and Ontario Ministry of Finance projections, 2028 (Reference Scenario).

Within the GTA, Toronto's population is projected to increase from 2.5 million in 1999 to 2.95 million by 2028. The other GTA regions will experience very strong growth, with York growing the fastest. Growth in Durham, Halton, Peel and York will add about 2 million people to the GTA over the projection period.

The population of Central Ontario will grow from 2,545,000 to 3,379,000. Its share will remain essentially unchanged at about 22 per cent. Most Census Divisions surrounding the GTA (Simcoe, Dufferin, Wellington, Waterloo and Victoria) will continue to experience above-average population growth.

The population of Eastern Ontario will grow from 1,549,000 to 1,873,000 over the projection period. Ottawa-Carleton is projected to grow from 764,000 in 1999 to 955,000 in 2028. Census Divisions near Ottawa-Carleton, such as Prescott and Russell and Lanark, also will experience above-average population growth.

The population of Southwestern Ontario will grow from 1,508,000 to 1,747,000. Growth rates for Southwestern Ontario vary, with the Census Divisions of Elgin and Essex projected to have growth rates close to the provincial average.

The population of Northern Ontario is projected to increase from 839,000 in 1999 to 868,000 by 2028. Growth rates within Northern Ontario vary.

New Projections vs. Previous Projections

Compared with the previous projections (1994), Ontario's projected population range is now expected to be significantly lower. This is due to a combination of factors.

First, the base population, estimated by Statistics Canada as 11.5 million in July 1999 in the current projections, is significantly lower than the population projected for 1999 in the reference scenario of the previous projections. This is due to significant population revisions by Statistics Canada following the 1996 Census and to methodological changes in estimating the level of emigration that lowered population estimates for Canada and the provinces, as well as to the choice of assumptions that overprojected some components of growth.

Second, the range of fertility assumptions adopted in these projections is lower (and narrower) than the previous range, thus generating fewer births compared to the previous projections. For instance, in the reference scenario, annual births are projected to increase from 131,000 in the first year to 150,000 in the last year of the projections. In the previous projections, the corresponding increase is from 148,000 births in 1999-2000 to 162,000 births in 2020-2021, the last projected year.

The life expectancy gains assumed in the current projections do not differ significantly from those in the previous projections. Thus, the age group 75 and over in the previous reference scenario was projected to reach 1.2 million in the year 2021 (the last projected year) compared to 1.1 million in 2021 in the current projections.

Finally, immigration assumptions are somewhat higher than the assumed levels in the previous projections, as are emigration and two of the net interprovincial migration assumptions. For total net migration, the range in these projections is somewhat higher but in the same order of magnitude as in the previous projections.

IV. Methodology and Assumptions

Projections Methodology

The method used in these long-term population projections is the regional cohort-component method. The method is basically a demographic accounting system. The calculation starts with the base-year population (1999) distributed by age and sex.

A separate analysis and projection of each component of population growth is made. Age- and sex-specific survival ratio assumptions and age-specific fertility rate assumptions are applied to the base-year age cohorts. This yields the projected annual deaths and births. Assumed annual levels of four migration streams (immigration, net emigration, interprovincial and intraprovincial migration) are then added to the population cohorts to obtain the population of the subsequent year by age and sex.

This step is done first for each of the 49 Census Divisions (CDs). The Ontario population is then obtained by summing the projected CD populations.

It should be noted that the population projections are demographic, based on assumptions about births, deaths and migration over the projection period. Assumptions are based on analysis of past trends of these components and expectations of future direction. The degree of uncertainty inherent in projections is represented by the range between the high and low growth scenarios, with the medium or reference scenario representing the most likely outcome.

The Base Population

The base population is the updated postcensal estimate (i.e., post-1996 Census) for each Census Division, by age and sex, estimated by Statistics Canada for July 1, 1999. The estimates at the CD level used in these projections were first released by Statistics Canada in January 2000.

Component Assumptions

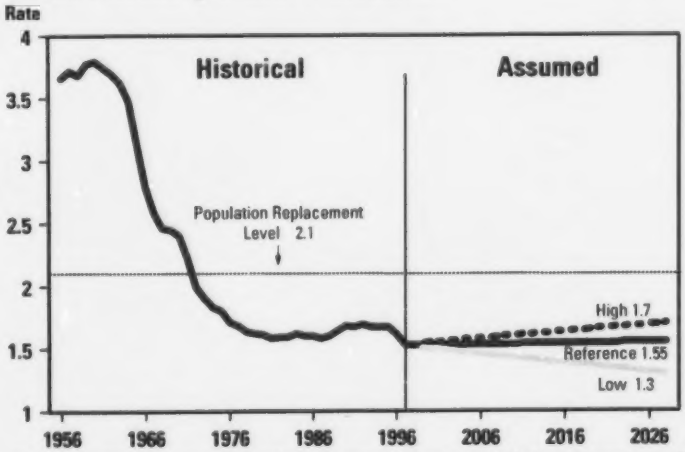
Assumptions for each component of population growth—fertility, mortality and migration—were first developed at the provincial level. Then, assumptions specific to each Census Division were determined.

Fertility

The projected number of births for any given year is obtained by applying age-specific fertility rates to cohorts of women in the reproductive age group, from ages 15 to 49. Instead of projecting some 35 age-specific rates, the projection model relies on a four-parameter Pearsonian curve to generate the fertility rates. The first of these parameters, the total fertility rate (TFR), reflects the level of fertility while the other three parameters (the mean age at childbirth, the skewness and the variance of the distribution) reflect the timing, or age, at which women have their babies.

The first step is to determine a set of three fertility assumptions at the Ontario level to provide a plausible range (high, medium, low) for the future. Assumptions were based on a careful analysis of past fertility trends in Ontario and a review of fertility trends elsewhere in Canada and in other countries. Fertility assumptions developed by Statistics Canada and other statistical agencies provided some perspective and helped in assessing the direction and scope of the proposed range of assumptions. The fertility assumptions for three scenarios, along with historical trends, are presented in the chart below.

Total Fertility Rate*, Ontario



* Total Fertility Rate is the sum of age-specific fertility rates during a given year. It indicates the average number of children per woman during her lifetime if the current fertility rates prevail over her reproductive period.
Sources: Statistics Canada, 1956-1999, and Ontario Ministry of Finance projections assumptions.

Fertility Level

Following half a century of a quasi-continuous decline, the fertility level in Ontario has recently reached the lowest level ever recorded: 1.53 children per woman in 1997, according to Statistics Canada data (Health Statistics Division). This is less than half the level at the peak of the Baby Boom (in 1960) when Ontario's total fertility rate (TFR) reached 3.8 children per woman with a record 159,000 births registered that year. In 1972, fertility crossed the replacement level of 2.1 children per woman.

Most researchers agree that fertility levels in the future are unlikely to parallel the high levels observed in the fifties and early sixties. Rather, it is believed that fluctuations of small amplitude are more likely, around values below the replacement level and within a fairly narrow range.

In the *reference scenario*, the TFR is assumed to increase slightly from 1.53 to 1.55 children per woman by the end of the projection period. This is an almost constant fertility assumption.

In the *low growth scenario*, the downward fertility trend is assumed to continue until the TFR reaches 1.3 children per woman at the end of the period.

In the *high growth scenario*, a reversal of the downward fertility trend is assumed. The fertility level increases gradually up to 1.7 children per woman by the end of the projection period.

Age-pattern of Fertility

Of the three parameters required to determine the age pattern of fertility (the mean age at childbirth, the skewness and the variance), the mean age at childbirth is the only one for which three assumptions were developed. The other two parameters were kept constant at their most recent level, as their impact on the projected number of births is very small.

For the mean age at childbirth, three assumptions were selected, all reflecting a gradual, small increase in the age at which mothers have their babies—to 30 years, 31 years and 32 years in the high, reference and low scenarios respectively by the end of the projection period. Currently, Ontario mothers tend to have their babies around age 29 to 30, on average. Twenty years ago, the mean age was 26 years.

Lately, the mean age has increased annually by about 0.1 to 0.2 of a year. This tendency to delay childbearing is observed in many countries. It is believed that this trend will continue, although at a reduced pace.

Fertility Assumptions at the Census Division Level

At the Census Division or county level, the fertility assumptions were developed using a ratio methodology. Annual ratios of total fertility rates of CD-to-Province were calculated for each year from 1986 to 1997.

The analysis of these ratios over time revealed a movement towards the reduction of regional fertility rate disparities between 1986 and 1997, although significant disparities still exist among regions. In these projections, the pattern of regional disparities was held constant at the most recent level.

The ratios of fertility rates for CD-to-Province observed in 1997 were then applied to each of the three fertility levels assumed at the Ontario level. This provided the assumed values of total fertility rates by Census Division (high, medium and low assumptions) for each year of the projections.

Mortality

The projected number of deaths each year is obtained by applying age-specific mortality rates to population cohorts in corresponding ages. As with the fertility component, a parametric approach was used to generate the annual age-sex specific mortality rates for each year of the projections.

Within this model, assumptions must be developed for two indicators or parameters: (i) life expectancy at birth for males and females for the projection period; and, (ii) the relative rate of change expected at each age. Furthermore, a set of age-specific mortality rates for each region is required for the beginning of the projections, reflecting the current mortality pattern. The model interpolates for the years in between.

A set of three assumptions of life expectancy at birth were first developed for the province as a whole, all reflecting a continuation of the improvement (gains) recorded in the average duration of life. The historical analysis of mortality trends covered the 1986 to 1997 period.

The province of Ontario boasts one of the highest levels of life expectancy in Canada and among the countries of the developed world. Currently, a newborn female in Ontario can expect to live beyond 81 years and a newborn male, beyond 76 years. Over the last decade, average gains in life expectancy have been in the order of 0.1 year per annum for females, and 0.2 year for males.

Gains have become somewhat smaller and it is expected that future improvements will continue to slow down. Gains in life expectancy will be more concentrated at older ages and are expected to be smaller for infants.

In the *reference scenario*, life expectancy in Ontario increases gradually from its recent level to reach 81.0 years for males and 84.5 years for females by 2028. This means total gains of 4.5 years for males and 2.9 years for females between the beginning and end of the projections.

In the *low growth scenario*, life expectancy increases at a slower pace, to 79.5 and 83.5 years for males and females respectively.

In the *high growth scenario*, life expectancy reaches 82.5 and 85.5 years.

Life Expectancy, Ontario

	1976	1986	1996	2006	2016	2026	2028
Male							
At Birth	70.8	73.8	75.9	77.6	79.1	80.7	81.0
At Age 40	33.7	35.8	37.6	38.9	40.4	41.8	n/a
At Age 65	13.9	15.0	16.1	17.1	18.2	19.2	n/a
Female							
At Birth	78.0	80.0	81.3	82.3	83.3	84.3	84.5
At Age 40	39.9	41.3	42.4	43.6	44.4	45.2	n/a
At Age 65	18.2	19.2	19.9	20.9	21.5	22.1	n/a

Source: Statistics Canada, 1976-1996, and Ontario Ministry of Finance projections assumptions (Reference Scenario).

Under each of the three mortality assumptions, male life expectancy is expected to progress at a faster pace than female life expectancy. This is in line with recent trends where males have been "catching up," that is, they have recorded slightly larger gains than females. Thus, the overall gap between males and females has diminished, and likely will continue to do so.

The assumed levels of life expectancy are assigned at the last year of the projection period. Values for intermediate years are obtained by linear interpolation. Finally, age-specific mortality rates are derived for each year, as required by the parametric projection model, after translating the overall life expectancy levels into relative gains at each age.

Mortality Assumptions at the Census Division Level

At the Census Division or county level, the mortality assumptions were developed using a ratio methodology. Annual ratios of life expectancy at birth for CD-to-province were calculated for each year from 1986 to 1997. A few smaller CDs had to be grouped together to provide a large enough population and number of deaths sufficient to build the life tables.

The analysis of the CD-to-province ratios did not reveal a consistent pattern or movement towards a reduction or accentuation of regional disparities over time. The projections use the most recent ratios and hold them constant throughout the projection period.

These assumed constant ratios were then applied to each of the three assumptions of life expectancy at the Ontario level. This provided the assumed life expectancy levels by Census Division (high, medium and low assumptions) for each year of the projections.

International Migration

Immigration

Immigration has been a very important factor of population growth in Ontario. Between 1991-92 and 1998-99, a total of 946,250 immigrants came to Ontario. This represents 53 per cent of all immigrants to Canada in that period. In 1998-99, the most recent year of data, Ontario received 92,000 immigrants.

Immigration levels or targets in Canada are determined by federal government policies. Each year, the federal Minister of Citizenship and Immigration announces publicly the level of immigration to be achieved in the coming year. For the calendar year 1999, the Canadian level was set between 200,000 and 225,000 immigrants. This level has remained unchanged for the year 2000. Although recently the number of immigrants landing in Canada has been lower than the planning levels, it is expected that immigration could fall within the target range in 2000.

There are several categories of immigrants (refugees, family reunion, economic and independent immigrants). Numerous factors influence the annual levels set for each category. The fairly large fluctuations observed in the past, the fact that immigration targets are set by the federal government, and the fairly stable share of immigrants coming to Ontario (averaging 53 to 54 per cent in the past 10 years) are all factors that were taken into account in establishing the range of future levels.

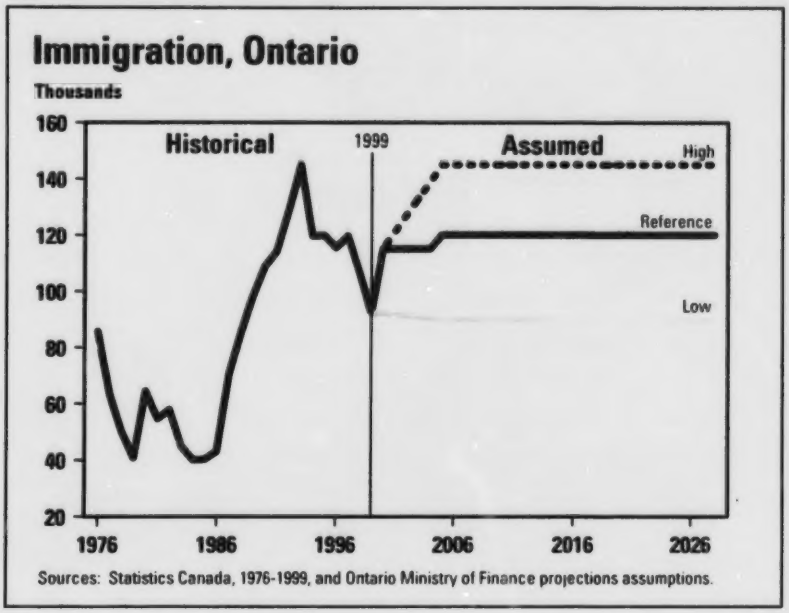
The three assumed immigration levels are shown in the following chart. Under all three scenarios, long-term immigration levels are assumed to be reached by the year 2004-05. They are kept constant at that level in subsequent years.

In the *reference scenario*, the immigration level is set at 115,000 at the beginning and is increased to 120,000 in 2004-05. This level is held constant thereafter.

In the *low growth scenario*, a slightly declining, quasi-constant immigration level is assumed, declining from 92,000 in the first year to 90,000 by 2004-05 and held constant in subsequent years.

In the *high growth scenario*, the immigration level increases gradually from 115,000 in the first year to reach 145,000 per year by 2004-05. Such a high level was recorded in Ontario in 1992-93 when a large number of refugee claimants were granted immigrant status.

The range between the upper bound of 145,000 immigrants per year in the high scenario and the lower bound of 90,000 per year in the low scenario gives an indication of the large fluctuations in immigration observed in the last 10 years and is a measure of the uncertainty involved in the projection. For instance, in the period 1986-91, immigration to Ontario averaged 95,000 per year but in the following five-year period, it climbed to 126,000 per year on average.



As a percentage of the Ontario population, the reference immigration assumption corresponds to 1.0 per cent, the low assumption to 0.7 per cent and the high assumption to 1.1 per cent of the projected populations of Ontario in 2006. This compares to 1.1 per cent over the 1990s. At the end of the projection period, the reference assumption of 120,000 immigrants per year would correspond to 0.8 per cent of the projected Ontario population. This compares to 0.7 per cent for the low and 0.9 per cent for the high immigration assumptions.

Immigration Assumptions at the Census Division Level

Projected immigration shares for each Census Division or county were based largely on the distribution of immigrants by Census Division in the recent past. These shares remain constant throughout the projection period. The age-sex distribution of immigrants observed recently also was assumed to remain constant.

Emigration

The number of emigrants is difficult to assess with a high degree of accuracy because there are no registration systems that count the number of people who leave Ontario and move to another country.

Statistics Canada publishes annual estimates of these flows based on a variety of indirect sources (administrative data files and postcensal surveys).

The level of net emigration from Ontario has increased significantly in the three most recent years, from 25,000 in 1996-97 to over 30,000 in 1998-99. These figures are a measure of net emigration, that is, gross international emigration flows minus returning emigrants. These estimates are higher than previously estimated and not easily comparable with long-term series as they include, since 1996, a category called temporarily abroad (mainly people on work/study visas abroad).

Several indicators point towards an increase in the number of emigrants in the future as more Canadians apply for and are granted renewable working permits (either through NAFTA or other agreements, particularly with the United States). However, administrative data on visas and permits are still preliminary and more time is needed to assess these emerging trends.

In this volatile context, two assumptions of net emigration were developed. In the *reference scenario* and *high growth scenario*, net emigration is assumed to remain unchanged at its estimated current level. In the *low growth scenario*, net emigration is assumed to increase gradually to reach 41,000 by the end of the projection period. This increasing emigration level (coupled with an increasing population) corresponds to a quasi-constant propensity to emigrate of about 0.3 per cent.

Emigration Assumptions at the Census Division Level

Projected shares for each Census Division were obtained by applying the recent percentage distribution of provincial emigrants by CD to the assumed total levels for Ontario. Recent age-sex distributions were applied and assumed to remain constant.

Non-Permanent Residents

Statistics Canada estimates that there were about 108,000 non-permanent residents living in Ontario in mid-1999 (e.g., foreign students, temporary workers, refugee claimants, etc.). These foreign residents are included in the base population as they are counted in the Census. However, the year-to-year change in the total number must be accounted for as a component of population growth. Determining assumptions for this component is a complex task because of the significant year-to-year fluctuations and the transient nature of this group. For instance, in 1997-98, the reduction in the number of non-permanent residents over the previous year in Ontario was 4,000 people; the next year, a gain of 2,000 was recorded.

Because of these fluctuations, only one assumption of a zero change in the stock of non-permanent residents is used (at both the provincial and Census Division levels).

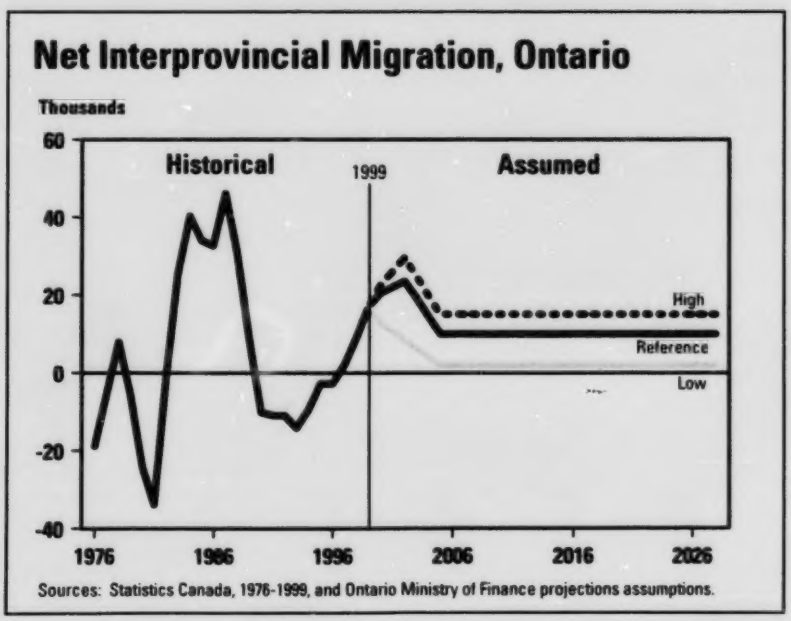
Interprovincial Migration

Interprovincial migration is a component affected by wide year-to-year fluctuations, often in opposite directions. Although Ontario remains a major province of attraction for migrants from other provinces, the trend analysis reveals a mixed pattern of several years of gains followed by several years of losses in the last two decades.

Starting in 1996-97, the migration pattern has been positive with increasing net gains for Ontario in each year since then: +2,000, +9,000 and +17,000 (the latter is 1998-99 preliminary data). Because of positive economic indicators, interprovincial migration gains are expected in Ontario in the next few years.

Net interprovincial migration has contributed positively to Ontario's population growth for a total gain of 183,000 migrants since 1981-82, averaging 10,000 per year. The recently estimated level of 17,000 net interprovincial migrants into Ontario is higher than the long-term average.

Three scenarios of interprovincial migration were developed at the provincial level. In the reference and high growth scenarios, the recent momentum of net gains is assumed to continue over the next three years. Then, starting in 2002-03, migration levels are assumed to decline to reach long-term levels of 10,000 (reference scenario) or 15,000 (high scenario) within two years. In the low scenario, net levels are expected to decline gradually to reach a long-term level of 2,000. See the chart below.



In the *reference scenario*, the average net gain to Ontario starts at 20,500 at the beginning and is assumed to increase up to 23,500 by 2001-02. Starting in 2002-03, net migration is assumed to move to a long-term level of 10,000 by 2004-05, reflecting the average gain of the last two decades.

In the *high growth scenario*, the average gain starts at 22,500 in the first year and a pattern of short-term upswing is assumed. Net migration peaks at 29,500 in 2001-02, after which it declines to 15,000 by 2004-05. This level is kept constant in subsequent years.

In the *low growth scenario*, net migration is assumed to decline from the most recent estimated level of 17,000 (estimates for 1998-99) to 2,000 by 2004-05 and is then held constant.

Historical analysis of interprovincial migration has shown that the level of in-migration tends to increase when net migration increases, while the level of out-migration tends to decrease. Regressions of the in- and the out-flow on the net flow and the estimated equations to predict the in- and out-flow corresponding to each assumption of net migration were used.

The in-flows corresponding to the target net migration levels in the low, medium and high growth scenarios respectively are 85,000, 87,000 and 88,000. The corresponding out-flows are 83,000, 77,000 and 73,000.

Interprovincial Migration at the Census Division Level

At the Census Division or county level, the long-term distribution of interprovincial migrants was derived mainly from the average annual share during the 1981-1997 period. The most recent share for each CD is expected to gradually reach the long-term level by 2004-2005. The age-sex distribution of interprovincial migrants in recent years was assumed to remain constant.

Intraprovincial Migration

At the Census Division or county level, there is an additional, important component of growth, namely intraprovincial migration or the movement of population within the province. For most Census Divisions, it is the most important component of population growth but also the most difficult to predict.

This component affects the population growth only at the Census Division level. At the Ontario level, intraprovincial movements net out to zero.

Only one assumption of intraprovincial migration is provided in the current projections, both for the total number of migrants and for the distribution by Census Division.

The total number of in- and out-intraprovincial migrants was first determined for each projected year for the province as a whole by applying a constant propensity or rate of intraprovincial migration to the total population of Ontario. The assumption is that 3.4 per cent of Ontario's population moves within the province (i.e., between the CDs) in any given year. In the first year of the projections, this translates into a total of 391,000 in- (or out-) movements. The same propensity, combined with an increasing overall population, will generate numbers of migrants that increase over time.

Intraprovincial Migration at the Census Division Level

After the provincial propensity to move between the CDs was determined, and the total number of in- and out-migrants generated for each projected year at the province level, the corresponding regional distributions were calculated.

The projected share of intraprovincial migration for each Census Division was derived largely by analysis of historical trends. The most recent age-sex distribution of intraprovincial migrants was assumed to remain constant throughout the projection period.

Sources: Statistics Canada, 1996 to 1999, and projections of Ontario Ministry of Finance.

Notes: 1. Reference Scenario assumes fertility increases slightly to 1.55 by 2028.
Immigration increases to 120,000 by 2004 and is held constant thereafter.

2. Low Scenario assumes fertility declines gradually to 1.3 by 2028.
Immigration declines to 90,000 by 2004 and is held constant thereafter.

3. High Scenario assumes fertility increases gradually to 1.7 by 2028.
Immigration increases to 145,000 by 2004 and is held constant thereafter.
